Title : Zeeman's effect in the spectrum of the exciton of cuprous-sulfate crystals

Periodical : Dok. AN SSSR 99/4, 527-528, Dec 1, 1954

Abstract : A study of the causes of existance of an abundant number of absorption lines in the spectrum "of the Cu<sub>2</sub>O" exciton (combination of a hole and an electron) is described. The study was conducted with the help of a wide dispersion spectral apparatus in a strong magnetic field. Four USSR references (1952-1954). Table; illustrations.

*K* Zeeman effect in the yellow series of exciton of a rutileous oxide crystal. B. F. Gross, B. P. Zakharcheyn, and N. M. Reynov (Phys.-Tech. Inst., Acad. Sci. S.S.R., Leningrad.) *Zhur. Tekhn. Fiz.*, 26, 700-1 (1960). — In addn. to previous investigations of the absorption lines of  $\text{Cu}_2\text{O}$  crystals (cf. *C.A.* 50, 09304) the Zeeman effect of the yellow series was measured with a spectrograph of 1.5  $\text{\AA}/\text{mm}$ . dispersion at 1.3°K. (the crystal was cooled with liquid He). In a magnetic field of 27000 oersteds, lines of the series  $n = 3, 4, 5$ , and 6 on the absorption spectrum, in nonpolarized light, changed into doublets. The sepn. of the line  $n = 2$  was not accomplished as a result of its great width. The investigations in polarized light indicated that the doublets may be observed in both  $\pi$  and  $\sigma$  components. The distance  $\Delta\lambda$  between components of doublets was const. for all lines and was equal to the distance between  $\sigma$  components ( $\Delta\lambda = 1.0 \text{\AA}$ ) of the first line of the series. The lines of the series sepn. in a magnetic field were displaced toward the short wave lengths, relative to their initial position in the absence of the magnetic field. The displacement was increased with the quantum no. of the line, for  $n = 5$  it was 0.5 $\text{\AA}$ . in a magnetic field of 27000 oersteds. Paul Palivenco

TITLE:

Temperature Dependence of Arbitrary Magnetization in Ferrites Co-Zn at Low Temperatures. (Temperaturnaya zavisimost' samoproizvol'noy namagnichennosti v Co-Zn-ferritakh pri nizkikh temperaturakh, Russian).

PERIODICAL:

Radiotekhnika i Elektronika, 1957, Vol 2, Nr 3, pp 342 - 344  
(U.S.S.R.)

Received: 5 / 1957

Reviewed: 6 / 1957

ABSTRACT:

Lecture delivered at the All-Union Conference for Semiconductors in November 1955 at Leningrad. The theory developed by Vonsovskiy and Agafonova makes it appear possible that a second type of ferromagnetic semiconductors, the "Exiton" ferromagnetic, which have two Curie points, exists. In the present work the experimental investigation of this assumption was extended to the domain of helium temperatures. Mixed Co-Zn ferrites were chosen as objects of investigation for the reason that a certain anomaly was observed with respect to their magnetic properties. The dependence on temperature of spontaneous magnetization of the Co-Zn ferrite scale with a content of ZnO of from 0 up to 0,9 within the domain of temperatures of from Curie point up to 1,3° K was investigated. The result showed that the decrease of the magnetic saturation moment in the case of a temperature drop of down to 1,3° K to be expected according to the theory by Vonsovskiy and Agafonova could not be

Co-Zn at Low Temperatures.

observed. Therefore, it may be assumed that the upper limit for the  
excitation energy of the exitons in these ferrites amounts to  
 $\Delta E \leq 10^{-16}$  erg.

TITLE: He-filled Proportional Counters under Low Temperature  
(Russian).

PERIODICAL: Zhurnal Tekhn. Fiz., 1957, Vol 27, Nr 2, pp 429 - 431  
(U.S.S.R.)

Received: 3 / 1957      Reviewed: 4 / 1957

ABSTRACT: In the case of the experiments dealt with by this paper the errors committed in measuring of temperatures amounted to roughly  $\pm 2\%$ . Therefore it was assumed that at a given temperature gas density depends linearly on pressure. At more than  $4.2^{\circ}\text{K}$  helium was assumed to be a perfect gas and at  $4.2^{\circ}\text{K}$  the data mentioned in papers for the density of saturated He-vapors at 760 torr were used. Test-counters were made, the construction of which allowed a temperature- and pressure-modification of He.  $\alpha$ -particles of  $\text{Po}^{210}$  were used in order to form the ionization-impulse. At  $4.22^{\circ}\text{K}$  in all cases an essentially lower value of the gas-intensification-coefficient was found than is the case with gases below normal temperature. Already in the case of a gas-intensification of the 10 - 20 order and less an independent discharge occurs in the counters. This limits the applicability of gas counters for operation

Card 1/2

He-filled Proportional Counters under Low Temperature.

with orientated kernels. In order to find out whether the reduction of gas-intensification is perhaps connected with the formation of a layer on the surface, a special construction for heating the filament by electricity was provided. The results are shown in two illustrations and they prove that the observed effect is not connected with an increased gas-purity. The experiments make it possible to conclude that the observed gas-intensification depends on the counter temperature. Since, however, existing theories exclude this, a new distribution of the potentials in the gas-space is the most probable explanation of this dependence. It is possible that this new distribution is due to the formation of a helium-film on the surface of the filament.

Low Temperatures (Ob ispol'zovaniyu germaniyevykh n-p- $\alpha$ -  
schetchnikov pri nizkikh temperaturakh).

PERIODICAL: Zhurnal Tekhnicheskoy Fiziki, 1957, Vol. 27, Nr 7,  
pp. 1599-1600 (USSR)

ABSTRACT: With reference to the paper in Zhurnal Tekhnicheskoy Fiziki,  
1955, Vol. 25, Nr 11 and 1957, Vol. 27, Nr 1 some preliminary  
results on the investigation of the counter-properties  
of germanium n-p-counters at helium temperatures are reported  
here. The scheme of the device is described. From the table  
of the comparative characteristics of the n-p counters at  
room temperature and at helium temperature is to be seen  
that at the temperature of liquid helium the signal-noise  
ratio strongly increases. At helium temperature (as well as  
at room temperature) the n-p counters have a good plateau in  
the counter-characteristic, as well as a saturation in the  
curve of the dependence of the amount of the impulse on the  
applied voltage. There are 2 figures, 1 table and 2 references,  
all of which are Slavic.

TITLE: Measurement of the  $\beta$ - $\gamma$ -Correlation of Orientated Nuclei  
(Izmereniye  $\beta$ - $\gamma$ -korrelyatsii oriyentirovannykh yader)

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1958,  
Vol 35, Nr 5, pp 1295-1296 (USSR)

ABSTRACT: Reference is first made to some earlier papers dealing with this subject. When investigating correlation, the authors constructed a device for the orientation of nuclei and took several measures for the purpose of extending the duration of measurements and improving their statistical accuracy. The main source of heat supply is thermal radiation, which passes through a light pipe, which is used for transmitting the flashes of light produced in a plastic scintillator during the recording of  $\beta$ -particles. The  $\beta$ -radiation asymmetry of  $^{60}\text{Co}$ -nuclei was measured. These cobalt nuclei were introduced into a thin superficial layer of a cesium-magnesium-nitrate crystal. The authors carried out their measurements

Card 1/2

Measurement of the  $\beta$ - $\gamma$ -Correlation of Orientated Nuclei

SOV/56-35-5-42/56

of the  $\beta$ - $\gamma$ -angular correlation on orientated  $^{60}\text{Co}$ -nuclei. The provisional data obtained by these measurements are not in contradiction to theoretical calculations which were carried out on the basis of the conservation of combined parity. Further, the investigation of  $\beta$ - $\gamma$ -angular correlation for

$\text{Mn}^{52}$  and  $\text{V}^{48}$  is planned. The authors thank A. I. Alikhanov, Academician, and Professor S. Ya. Nikitin for placing the  $\text{Co}^{59}$  at their disposal (this element is, by the way, less well suited for measurements of the here described kind); they further express their gratitude to A. Z. Dolginov for many useful discussions, and to O. V. Larionov for the chemical separation of  $\text{Co}^{58}$ . There are 2 figures and 6 references, 1 of which is Soviet.

## ABSTRACT:

The 5th All-Union Conference on this problem took place in Tbilisi from October 27 to November 1, 1959. It was attended by physicists from Moscow, Kharkov, Leningrad, Tbilisi, Saratov, and Kiev. A field of low-temperature physics were discussed: superconductivity of liquid helium II, superconductivity, dielectric properties, magnetic properties, etc. The following was also considered: anomalous heat conduction, the properties of superconductors, the influence of magnetic fields on the properties of superconductors, the theory of superconductors in the high-frequency magnetic field. D. V. Shchukin and N. Chubanov and Pashou Sichin, two young Chinese scientists working at Beccuo University, described investigations for determination of charges on superconductivity. V. V. Tolmachev explained the nature of the so-called collective excitations of the Bose type in superconductors. D. M. Zubarev, Yu. I. Fesenko, G. S. Dzhilkhanian, V. Z. Krasik of the thermal conduction of superconductors. Yu. V. Shurkin, V. P. Ganambekov reported on the relationship of superconductors. M. F. Savaryanly spoke on the measurement of the anisotropy of the thermal conductivity in the superconductive state. In a series of reports problems of the superconductivity of helium were discussed, which was discovered in 1938 by P. L. Kapitza and the theory of which was set up in 1941 by L. D. Landau. E. S. Andronikashvili and his co-workers investigated the properties of rotating helium. V. P. Feherov spoke of the effect of the formation of the boundary between superfluid and non-superfluid helium. G. Ivanov, a collaborator of the Institute of Physics Problems (Institute of Physical Problems) investigated the properties of the so-called jump in temperature of Kapitza. M. I. Lifshitz, V. B. Feshchenko investigated galvanomagnetic phenomena in strong magnetic fields for metals with open Fermi surfaces. N. V. Alekseyevsky, Yu. P. Gaydukov experimentally investigated the resistive anisotropy of 703 monocrystals in the magnetic field. I. S. Kan, B. G. Lebedev casting the presence of one-temperature minimum with the structural state of the metal. I. I. Abrikosov reported on the quantum theory of metallic conductivity in the alternating electromagnetic and constant magnetic field. A. S. Burotik-Bordoni reported on the weak ferromagnetism in antiferromagnetic samples of  $MgCO_3$ ,  $Mn_2O_3$ ,  $Fe_3O_4$ . A. S. Baryak and S. I. Felemanik spoke of computations of the antiferromagnetic monocrystals  $CuSO_4$  and  $CoSO_4$ . A. Alkhakov reported on neutronographic investigations of antiferromagnetic structures. I. A. Gindin, B. G. Lebedev, and collaborators reported on the susceptibility of metals at low temperatures. E. L. Andronikashvili, V. P. Pashkov and M. P. Malkov reported on the results of paramagnetic resonance of terbium in the  $TbBa_2O_6$  strate. G. R. Khutashvili gave a theoretical analysis of the orientation of the nuclear spin in the Overhauser (Overhauser) effect in nonmetals. B. M. Sanoylov, J. M. Rykov and collaborators reported on obtaining oriented nuclei  $^{27}Al$ ,  $^{29}Si$ ,  $^{31}P$ ,  $^{37}Cl$ ,  $^{63}Cu$ ,  $^{65}Zn$ ,  $^{75}As$ ,  $^{87}Rb$ ,  $^{133}Cs$ ,  $^{153}Eu$ , TITLE: On the Elastic Limit of Tin and Indium

PERIODICAL: Fizika tverdogo tela, 1959, Vol 1, Nr 8, pp 1279 - 1280 (USSR)

ABSTRACT: During some investigations carried out at temperatures of liquid helium not only new particularities in the behavior of stressed metals but also a considerable influence of temperature lowering upon the processes to be examined has been found. Therefore, a continuation of this work at extremely low temperatures is of interest. Basing on metal elastic limit measurements the possibility of tensile tests at temperatures below 1°K has been explained. The transition from the range of elastic deformation to the range of irreversible deformations was consulted to determine the elastic limit by recording heat liberation at the beginning of nonelastic sample deformation. Preliminary experiments were made with polycrystalline tin samples (residual resistivity:  $3 \cdot 10^{-3}$ ) at  $0.1^\circ$  -  $0.3^\circ$ K. Cooling was brought about by adiabatic demagnetization of a paramagnetic salt into which the cold-conductor (kholodoprovod) was pressed together with the sample soldered to it. The temperature ✓

Card 1/2

67315

On the Elastic Limit of Tin and Indium

SOV/161-1 -8-20/32

of the sample was determined from magnetic susceptibility.

With a stress of  $1.8 \text{ kg/mm}^2$  upon tin and of  $0.24 \text{ kg/mm}^2$  upon indium the samples lost superconductivity. With these stresses a nonelastic deformation probably has already been present in the samples so that the elastic limit does not exceed the above values. The authors do not have any information on publications concerning measurement of the elastic limit of tin and indium by way of low-temperature stretching. Experiments with single crystals at still lower temperatures will permit the recording of smaller heat quantities liberated during deformation and also a more accurate determination of the elastic limit. The authors thank A. V. Stepanov and V. I. Khotkevich for the discussion of the present paper. There are 1 figure and 4 references, 3 of which are Soviet.

**ACTION:**  
**TITLE:** The Fifth All-Union Conference on the Physics of Low Temperatures (5-ya Vsesoyuznaya simechansya po fizike miskich temperatur)

**PUBLICATIONS:** Uspishi fizicheskikh nauk, 1959, Vol. 67, No. 4, pg 743-750  
 (USSR)

**ABSTRACT:**

This Conference took place from October 21 to November 1, 1958. It was organized by the Odzeleniya fizicheskikh i matematicheskikh Nauk Akademii nauk SSSR (Department of Physics and Mathematics of the Academy of Sciences of the USSR), the Akademicheskaya Nauk Gruzinizhnaya (Academy of Sciences, USSR), Gruzininskaya SSSR (Academy of Sciences of Georgia), and the Tbilisskaya Gosudarstvennaya Universitet (Tbilissi State University). The Conference was attended by about 300 specialists from other cities as well as by a number of young Chinese scientists who were visiting in the USSR. About 50 lectures were delivered which were divided according to research fields.

One of the most interesting lectures delivered at this Conference was that by I. A. Gindin, N. G. Lebedeva, T. D. Starodubov and V. I. Zhukovskiy (Karpov Institute) on the polymorphism of metals at low temperatures. L. Kvitko commented on this topic during the discussion. N. G. Lebedeva, V. S. Kochan and B. G. Lazarev (Karpov Institute) investigated the system hydrogen-deuterium by the methods of low-temperature-micrography, thermal analysis, and the visual observation of crystallization. M. I. Abrikosov, Sh. Kh. Shakhnazarova and R. I. Sashkov investigated the thermoplastic properties of compounds of the type  $\text{Ar}_2\text{N}^+ \text{Ar}_2\text{Y}^-$  and  $\text{Ar}_2\text{Y}^+$ , and dealt with the phenomenon of the "pitcher effect" predicted by Gor'evich. The investigation was carried out at the Daghestanskii filial of SSSR (Daghestan Branch, AS USSR).

E. M. Burmistrov and A. P. Smirnov (LPI - Leningrad Physico-Technical Institute) gave a report on the measurement of the electric strength limits of tin- and indium polycrystals at very low temperatures ( $1^\circ\text{K}$ ), and M. M. Peresov and M. T. Ezhukov (LPI) spoke about attempts made to find the magnetic resonance of protons in cuprous oxide. O. S. Zhdanov (PGU 1 Institute of Physics, AS Ukrainskaya SSR - Ukrainian State University and Institute of Physics AS Gruzininskaya SSSR) carried out a theoretical investigation of the Overhauser effect in non-metals. Lekhtakidze investigated the electron- and nuclear resonance in diphenylpicryl hydrazot at helium temperatures. B. N. Sushkov spoke about experiments he carried out concerning the interaction of  $\text{Co}^{+2}$  and  $\text{Au}^{+1}$ -nuclei (in iron) at extremely low temperatures. B. I. Tchirkachenya and Ye. F. Orlova (LPI) investigated the absorption spectrum of a copper oxide crystal in the magnetic field at helium temperatures and observed the effect of magneto-optical oscillations. V. P. Pavlov and N. P. Luk'yakov gave information concerning scientific work of Soviet scientists in foreign countries (Magranichnaya nauchnaya dokonchivka), and E. I. Shabot'yan spoke about the abstracting journal "Fizika i temperatura".

The head of the department for problems of the Physics of low temperatures, Academician P. L. Kapitza and the President of the Academy of Sciences Gruzininskaya SSSR, M. I. Bakhshayev closed the Conference. The 6th All-Union Conference on the Physics of Low Temperatures will be held in June and July 1959 in the city of Stev'dol'sk.

TITLE: Determination of the Elastic Limit of Metals at Ultra-low Temperatures

PERIODICAL: Pribory i tekhnika eksperimenta, 1960, Nr 1,  
pp 128 - 130 (USSR)

ABSTRACT: The temperatures involved are less than 1°K. Figure 1 shows a schematic drawing of the apparatus employed to determine the elastic limit of superconducting metals by a thermal method. The very low temperatures (down to 0.05°K) were obtained by adiabatic demagnetisation of a paramagnetic salt (Ref 4). The specimen (21) of the metal under investigation was in the form of a wire 0.1 - 0.4 mm in diameter and 5-10 mm long. One end of the wire was attached to a silver rod (20) pressed into a block of the paramagnetic salt (10). In order to reduce the supply of heat to the working block a similar buffer block (8) was placed as shown in Figure 1. The lower end of the specimen was attached to the silver extension arm (16) which in its turn was attached to the iron core (24) of the electromagnet. To prevent the

**Determination of the Elastic Limit of Metals at Ultralow Temperatures**

heating of the specimen by light, special diaphragms (1) were inserted and the specimen was screened by the glass tube (22) covered with silver paste which was in contact with the working block (10). The electromagnet can produce stresses of up to 100 g. The specimen was surrounded by the solenoid (13) which produced an axial magnetic field of 550 Oe at 0.5 A. The electrical resistance was measured by the induction method described by Samoylov in Ref 5 with the aid of the three coils (15), (23), having a large number of turns and the two coils (14) made of a super-conducting wire and directly connected with the specimen. The elastic limit was determined as follows. As soon as the lowest temperature due to the demagnetisation of the salt was reached, a preliminary determination was made of the rate of heating of the working block of salt due to the natural leak of heat. Next, a determination was made of the critical magnetic field for which the specimen goes over from superconducting to the normal state as a function of temperature. The magnetic field of

Determination of the Elastic Limit of Metals at Ultralow Temperatures

the solenoid is adjusted so that heating of the specimen through 0.1 - 0.2 K from the starting temperatures causes its transition from the superconducting to the normal state. The stress is then applied to the specimen with the aid of the electromagnet and the natural heating of the specimen during the extension should be less than 0.1 K. When the resistance of the specimen appears, the load on it is noted and this determines its thermal elastic limit. It was found that the minimum value of the elastic limit of monocrystalline specimens of tin is 200 g/mm<sup>2</sup>. There are 2 figures and 8 references, 4 of which are Soviet, 2 German and 2 English.

Sokolov, I. A., Stein'makh, M. F.TITLE: The Polarization of  $\text{Sc}^{46}$  Nuclei in IronPERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1960,  
Vol. 39, No. 1 (7), pp. 47-52

TEXT: B. N. Samoylov, V. V. Sklyarevskiy and Ye. P. Stepanov (Refs. 8-10) succeeded in polarizing the nuclei of a number of weakly magnetic elements alloyed with ferromagnetics. They discovered the possibility of orienting the nuclei of many elements including scandium. In the present paper, the first results found by the authors on the orientation of

Sc<sup>46</sup> introduced into iron are published. Fig. 1 shows a schematic cross section of the apparatus employed for the purpose. Its description is given in the introduction. To check the working of the apparatus, experiments were first made on the orientation of Co<sup>60</sup> in iron ( $\leq 0.02\%$  Co) which are described in detail. Fig. 2 shows the asymmetry of the gamma

✓

radiation of Co<sup>60</sup> as a function of temperature. The asymmetry is characterized by  $\epsilon = [I(\pi/2) - I(0)]/I(\pi/2)$ . Next, the experiments carried out on scandium are described. The neutron irradiated scandium was introduced as a metal into pure iron (Sc concentration  $\leq 0.5\%$ ). A large number of asymmetry measurements of the gamma radiation from Sc<sup>46</sup> were made in the temperature range of from 0.03 to 0.015°K. At the lowest temperatures  $\epsilon = 2.5\%$ . The sign of the asymmetry agreed with the known dipole character of the cascade gamma transitions in Ti<sup>46</sup>. Fig. 3 shows the asymmetry of gamma radiation for temperatures of the cooling salt between 0.025-0.03°K.  $\epsilon$  was also measured for other temperatures. At 0.04-0.05°K,  $\epsilon$  was 1%, at  $\sim 1.2^{\circ}\text{K}$ , however, it was 1.8%, showing that the temperature dependence of the asymmetry of gamma radiation for small values of  $1/T$  cannot be determined with sufficient accuracy. The magnetic moment of Sc<sup>46</sup> was not measured. Still, it can be estimated with sufficient accuracy to be 3.5 nuclear magnetons, from which the effective magnetic field on C<sup>46</sup> nucleus in iron for  $1/T = 25$  is found to be  $H_{\text{eff}} \approx 10^5$  oersteds. The

B006/B070

possible errors in this determination are then discussed. They are related to the errors in the determination of nuclear magnetic moments,  $\epsilon$ , and T, and the error resulting from imperfect domain orientation.

Taking these into account  $H_{eff}$  lies within the limits  $3.0 \cdot 10^5 \leq H_{eff} \leq 4.0 \cdot 10^5$  oe for Co<sup>60</sup> and  $0.70 \cdot 10^5 \leq H_{eff} \leq 1.30 \cdot 10^5$  oe for Sc<sup>46</sup>. Finally, the possible investigations of  $\beta\gamma$ -correlation for oriented Sc<sup>46</sup> nuclei are very briefly discussed. The authors thank Professor N. P. Sazhin for making available metallic scandium, and Professor A. Z. Dolginov for the derivation of the asymmetry formula. G. R. Khutsishvili and L. M. Shestopalov of Fiziko-tehnicheskiy institut AN SSSR (Physicotechnical Institute of the AS USSR) are mentioned. There are 3 figures and 21 references: 7 Soviet, 8 American, 1 Canadian, 3 Dutch, and 2 British.

TITLE:

Investigation of the destruction of superconductivity in  
thin tin films

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 40,  
no. 6, '96'. 1543 - 1550

TEXT: The possibilities of practically applying superconduction effects (cf. Proc IRE, #8, '253 and '395, '960) make it of interest to study the destruction of the superconductivity of thin metal films as caused by current. Subject to this work was to elucidate the regularities of the destruction of superconductivity by a magnetic field or a current, as well as to describe the laws governing the return of the film to the superconducting state on removal of the field (current) in a larger temperature interval. The investigations were limited to films of thicknesses (1-6)  $\mu$ m under the action of current pulses of different shapes and lengths and at temperatures near the critical one. The results of the measurements have

Card 1/5

B:02/B214

Investigation of ...

been presented earlier to the Seventh All-Union Conference on Low Temperature Physics in Khar'kov (June 1980). The films were prepared by vacuum sputtering ('0.5 mm Hg). Fig. 1 shows the appearance of such a sample with the current and voltage contacts. The backing was glass or mica, chemically purified and heated in vacuo. The film thickness was determined by weighing; the breadths of the films were 0.10 - 0.25 mm. The resistances of the films amounted to 30 - 130 ohms at room temperature. Direct current experiments were done with a potentiometer circuit with galvanometer or rheochord with automatic recording of current and voltage by recording potentiometers of the types ЭПП-09М (ЕРР-09М) and ЭПП-10М (ЕРР-10М). The transition of the sample to (from) the superconducting state was established by an oscillographic apparatus (use of an oscillograph of the type ЭН0-1 (ENO-1)) which allows to observe and photograph the volt-ampere characteristics. Generators of the types ГИС-2 (GIS-2) and ГИ-3М (GI-3M) were used to study the destruction of superconductivity by pulsed current (duration of the pulse 0.1 - 10 sec). The current and voltage were recorded simultaneously by a double-ray oscilloscope of the type ДДО-1 (ДЕСО-1). In direct current operation at 4.2°K. films of resistance of 1 - 6 ohms and resistivity 0.4 - 1 μohm/cm were investigated.

Card 2/5

Investigation of ...

25180  
S/056/61/040/006/001/031  
B102/B214

The critical temperature of these films for a measuring current of 40  $\mu$ A lay between 3.75 and 3.85°K and was therefore higher than for massive tin. The experiments showed that with increasing current the resistance increased first very slowly, and for currents over 10 mA more rapidly. The transition of the sample from the superconducting to the normal state on increasing current was investigated by taking measurements with triangular pulses. The influence of thermal effects on the transition could also be studied in this way. It was found that the sample was heated even by a rise and fall in the pulse of 0.1  $\mu$ sec each. This heating is attributed to the appearance of a hysteresis on transition from normal to the superconducting state. Fig. 8 shows a volt - ampere characteristic (pulse growth 0.5  $\mu$ sec, fall 0.1  $\mu$ sec, sequence 50 cps,  $I_{max} = 150$  mA). Further measurements were made by rectangular pulses of 0.7  $\mu$ sec (front 0.05 - 0.15  $\mu$ sec). Fig. 10 shows an oscillogram of the transitions of a sample from the superconducting to the normal state for a pulse length of 2  $\mu$ sec (upper curve: current, lower: voltage). The following results were obtained from the studies: The regularities found hold for films of such thicknesses for which the current destroying the superconductivity depends only slightly on the thickness.

Card 3/5

Investigation of ...

25180  
S/056/61/040/006/001/031  
B102/B214

For thinner samples, other regularities are to be expected. Under the action of very short pulses the transition is greatly affected by Joulean heat and heat caused by Foucault currents. Besides the hysteresis of thermal effects on transition from the normal state to the superconducting state, there is also observed a hysteresis which is attributed to the existence of superconducting domains in the normal phase. The duration of the spontaneous transition to the superconducting state is considerably smaller than that of the destruction of the intermediate state arising when the superconducting state is destroyed by current. The duration of transition from the superconducting to the normal state depends on the amplitude of the current in the pulse. For sufficiently large amplitudes, the transition time is  $t < 5 \cdot 10^{-9}$  sec. A. A. Galkin is mentioned. There are 12 figures and 10 references: 4 Soviet-bloc and 6 non-Soviet-bloc. TITLE: An apparatus for producing films by evaporation in  
vacuo

PERIODICAL: Pribory i tekhnika eksperimenta, no.3, 1962, 133-135

TEXT: A description is given of a laboratory apparatus (including a full sectional drawing) for the production of films of metals and dielectrics. It can be used to evaporate five different materials and to obtain (in a single pumping cycle) multi-layer systems consisting of films with ten different configurations in any desired sequence. The thickness of the films is determined *in situ* from their resistance. Alundum evaporators heated directly by tungsten spirals are employed (maximum temperature 1700 °K, 160 W). The pumping speed (oil diffusion pump) is 250 litres/sec and the working pressure is  $5 \times 10^{-6}$  mm Hg. The targets are cooled by liquid nitrogen. There are 3 figures.

direction of the detector,  $\pi(\pi)$  is the same if  $H$  has the opposite direction;  $A$  is a factor depending only on the spins  $I_1$  and  $I_0$  ( $I_1 \neq I_0$ ) of final and initial states,  $f_1$  - nuclear polarization coefficient,  $\vartheta$  - angle between the direction of nuclear polarization and that of particle emission. For Re and Ir the quantity  $10^{18} \mu_n^H$  was determined from the slope of the straight line  $\varepsilon_\beta(1/T)$  giving  $8 \pm 1$  for Re and  $4 \pm 0.5$  for Ir. These values do not agree with the results of  $\gamma$ -anisotropy measurements ( $2.5 \pm 0.5$  and  $12 \pm 1.5$ ); i.e. the relation  $\varepsilon_\beta(T) = A(v/c)f_1$  cannot be used. Since for these nuclei  $A < 0$  and  $\mu_n > 0$  it follows that  $H_{\text{eff}}$  will be negative. For Ir<sup>144</sup> also the nuclear spin relaxation time  $\tau_n$  in the field  $H_{\text{eff}}$  was determined. Up to  $\sim 0.1^\circ\text{K}$   $\tau_n \leq 70$  sec.  $\mu_n \leq 1.7 \pm 0.4$  nuclear magnetons and  $H_{\text{eff}}$  is also negative. There are 1 figure and 1 table.

TITLE: Measurement of the nuclear specific heats of iridium and rhenium in  
iron alloys

SOURCE: Zhur, ekspr. i teor. fiz. v. 45, no. 2, 1963, 1-7.

TOPIC TAGS: Nuclear specific heat, iridium, rhenium, magnetic moment, effective  
magnetic field, Re, Ir

ABSTRACT: A method for measuring very small nuclear specific heats and for estimating nuclear relaxation times in alloys is described. Such measurements are of interest because they can be used to determine the effective magnetic field and the magnetic moment of radioactive isotopes. The specific heats of the alloys were measured by comparison with the specific heat of a cooling mixture consisting of 50% saturated aqueous solution of cromiumagnetsium nitrate and 50% glycerin by volume, which in turn was determined in control experiments by comparison with the known specific heats of metallic cobalt and Fe-Co alloys with different concen-

5

trations. The nuclear specific heats of Re-Fe and Ir-Fe alloys of various concentrations were measured. The effective magnetic fields acting on the nuclei of the alloying metals were found to be  $(6.7 \pm 0.7) \times 10^5$  Oe for Re and  $(1.35 \pm 0.3) \times 10^6$  for Ir. The magnetic moment of Ir-192 was found to be  $(1.8^{+0.6}_{-0.5})$  nuclear magnetons. The possible errors of the procedure are estimated. The authors wish to thank Yu. M. Burdukov, A. A. Fogel, T. A. Sidorova, and Z. A. Garts for assistance in preparing the samples. Orig. art. has: 3 figures, 4 formulas, and 2 tables.

"Chemical Composition of Wild Plants Growing in Eastern Pamir With Respect to Their Value as Feeds" Plants growing in the high-altitude pastures of Eastern Pamir are high in soluble carbohydrates, hemicellulose and protein, which makes them valuable as feeds. The chemical composition of the plants depends on the altitude at which they grow. At high altitudes the carbohydrate, protein, and starch concentrations are greater.

TITLE: Dependence of carbohydrate metabolism shifts of plants on altitude

SOURCE: Vsesoyuznoye botanicheskoye obshchestvo. Problemy botaniki, v. 7, 1965. Voprosy biologii i fiziologii rasteniy v usloviyah vysokogorii (Problems of biology and physiology of plants at high altitudes), 159-164

TOPIC TAGS: plant ecology, plant metabolism, carbohydrate, agricultural crop, climatic influence

ABSTRACT: To study carbohydrate metabolism shifts of cultured plants taken from a temperate climate and introduced to the Pamirs, Nutans 027 barley was planted at the same time at the Leningrad Botanical Garden (sea level) and in the Pamirs at altitudes of 2320 m and 3860 m. Carbohydrate levels of plants were determined at different developmental stages. Barley grown in the Pamirs, particularly at 3860 m, displayed a marked increase of soluble carbohydrates, largely due to the high

O  
saccharose level. Compared to barley plants grown in Leningrad, the saccharose level of barley leaves grown at 3860 m was 8 to 10 times higher and the saccharose level of barley leaves grown at 2320 m was 2 times higher. Within the natural distribution limits, the carbohydrate levels of plants do not change with different altitudes. However, the transfer of high altitude flora to a temperate climate or the transfer of a temperate climate plant to a high altitude affect plant metabolism, particularly carbohydrate metabolism. Only the soluble carbohydrate levels are affected, but the polymer (starch, hemicellulose) forms remain unchanged. Orig. art. has: 4 figures.

TITLE: Miniature probe for measuring variable magnetic fields

SOURCE: Pribory i tekhnika eksperimenta, no. 2, 1966, 151-153

TOPIC TAGS: plasma probe

ABSTRACT: A miniature magnetic probe consisting of copper wire wound on nichrome wire 0.15 mm in diameter is described (see Fig. 1). The leads are twisted and recessed 1 cm and covered with organic material which hardens upon drying. The probe is placed into a Kovar sleeve whose outside diameter is 5 mm and is covered with a glass case which isolates the probe coil from plasma. The thickness of glass where the probe is located is 0.2 mm. The sleeve is inserted into a rubber cork which establishes a vacuum equal to  $10^{-5}$  torr. The leads are connected to a shielded coaxial cable reducing the portion exposed to fields to 10–12 mm. Five probes of different size were made. These include probes 1.2 and 1.6 mm in outside diameter with 70 and 160 turns, respectively. Measurements with a 1.2 mm-o.d. probe of mag-

TITLE: Application of Diphenyl Carbazone in the Photometric Determination of Copper in Iron and Steel (Primeneniye difenilkarbazona dlya fotometricheskogo opredeleniya medi v zheleze i stali)

PERIODICAL: Zhurnal analiticheskoy khimii, 1958, Vol. 13, Nr 4,  
pp. 426-429 (USSR)

ABSTRACT: In recent years, a number of photometric methods were suggested for the determination of copper in iron and steel (Refs 1-9), many of them, however, require special apparatus and reagents difficult to obtain. The authors found that the extremely sensitive reaction of copper with diphenyl carbazole under formation of a complex of low solubility in water is considerably more suited as compared with the methods of micro-determinations of copper described in publications. The formation of the complex is highly dependent on the pH-value. The best conditions are to be found about a pH of 4-5. The copper complex of diphenyl carbazole is not soluble in water and only difficultly soluble in ethanol, ether and carbon tetrachloride, whereas it is well soluble in benzene and its homologs. The red-colored solutions of the complex in benzene obey the law

Application of Diphenyl Carbazone in the Photometric Determination of Copper in Iron and Steel

of Lambert - Beer. Hence, they can be determined by quantitative photometric methods. Under the conditions of analysis diphenyl carbazole with the following cations does not form compounds soluble in benzene: Ag<sup>+</sup>, AuCl<sup>-</sup>, Zn<sup>2+</sup>, Al<sup>3+</sup>, Sn<sup>2+</sup>, V<sub>2</sub>O<sub>7</sub><sup>4-</sup>, Sb<sup>3+</sup>, Bi<sup>3+</sup>, WO<sub>4</sub><sup>2-</sup>, UO<sub>2</sub><sup>2+</sup>, F<sup>-</sup>, Mn<sup>2+</sup>, Fe<sup>2+</sup>, Fe<sup>3+</sup>, Co<sup>2+</sup>, Ni<sup>2+</sup>, Cr<sup>3+</sup>, PtCl<sub>6</sub><sup>2-</sup>, B<sub>4</sub>O<sub>7</sub><sup>2-</sup>, Ti<sup>4+</sup>, Tl<sup>+</sup>. Diphenyl carbazole

reacts with mercury only in the presence of chlorides, whereas with copper, molybdenum, cadmium and lead it reacts only at very high concentrations of these elements. The reaction is very sensitive and permits the photometric proof of 0,1 $\mu$ g of copper. In the quantitative determination of copper in steels and iron according to this method, the iron is kept in solution in a complex state by a surplus of primary sodium phosphate and ammonia. The error of determination does not exceed 4%. As this reaction is extremely sensitive, the apparatus has to be kept carefully clear of possible copper traces. The preparation of the initial solutions and the exact way of carrying out the determination of copper in iron and steels according to this method is described in detail, as well as the results of the

Title : New Reaction for Amines and Its use in Qualitative and Quantitative Analysis.

Orig Pub : Sb. nauchn. tr. Samarkandsk. med. in-t, 1956, 11, 117-124

Abstract : It was found that on action of NaBrO on primary, secondary and tertiary amines there are formed bromamines which react with KI to set free an amount of I<sub>2</sub> that is equivalent to the amine. On the basis of this reaction there has been worked out a method for the qualitative and quantitative determination of amines. The analysis is carried out in a specially designed apparatus, consisting of a test tube, 2.5-3 cm in diameter, with a stopper into which is inserted a tube fitted with a funnel, and a Kjeldahl trap, two U-tubes and a water pump. For a

REISER, A.

The dipole moments of methoximes, A. Reiser, V. Ježický, and K. Dvořák (Czech. Univ., Prague), Collection Czech. Chem. Commun., 16, 13-22 (1951).—Methoximes are colorless, oily liquids of pleasant odor, stable in the pure state, but less pure samples deteriorate slowly under the influence of light. Benzophenone methoxime is cryst. and decomps. before melting. Consts. for pinacolone and cyclopentanone methoximes are, resp.: b.p./mm. Hg 52.5/56, 36/10;  $d_{4}^{20}$  0.8365, 0.9175;  $n_{D}^{20}$  1.4209, 1.4560;  $n_F - n_C$  0.03863, 0.03728;  $[K]_D$  exptl. 39.151, 32.456, calcd. 39.31, 32.30;  $\epsilon^2$  2.789<sub>4</sub>, —;  $\mu$  0.08, —. The ds., dielec. consts., and polarization of benzene solns. of the methoximes are tabulated. The dipole moments of the methoximes in dil. soln. ( $\mu_d$ ) and in the pure liquid ( $\mu_l$ ) of the following are, resp.: acetone 1.172, 1.20; 2-butanone 1.118, 1.19; pinacolone 0.931, 0.98; cyclopentanone 1.262, —; cyclohexanone 1.278, 1.25; benzaldehyde 0.630, 0.83; acetophenone 0.700, 0.93; benzophenone 0.389, —; cyclohexanone ethoxime 1.206, 1.22. The calcd. and exptl. dipole moments are compared. The slopes of the straight lines, the  $s$  values, are obtained by plotting the differences between the dipole moments of the halides RX and MeX vs. the electronic refractions,  $R$ , of C—Cl, C—Br, and C—I bonds and drawing straight lines through representative points of analogous halos. ( $s = \text{const.}$ ) to the origin (thus  $\mu_i \approx 0$  for  $R = 0$ ). The  $s$  values ( $\mu_i = \alpha.s$ , where  $\mu_i$  is an interaction term and  $\alpha$  is the polarizability of the functional group) are as follows: Me 1.0, dimethyl 2.2, trimethyl 3.1,  $\alpha$ -Me 0.5,  $\beta$ -Me 0.5, *tert*-Bu 3.1, cycloheptyl 3.1, cyclohexenyl 3.3, phenyl 2.2. The relatively low dipole moments of the methoximes prove that the Me group is attached to O, since *N*-Me ethers of the oximes would contain a semipolar bond with charges on N and O and would be much more polar. Minor variations in the dipole moments of aliphatic and alicyclic methoximes are attributed to inductive effects and steric factors. The behavior of aromatic members is explained by mesomerism, and it was noted that the dipole moment of the methoximes is proportional to the refractive exaltation.
